Magnetic resonance (MR) imaging is frequently used to examine patients who have low back pain with or without leg pain. The relationships between anatomic abnormalities of the lumbar spine detected at MR imaging, clinical history, and patient outcome are controversial.

Lumbar Spine: Reliability of MR Imaging Findings

Magnetic resonance imaging (MRI) of the lumbar spine is a safe and painless test that uses a magnetic field and radio waves to produce detailed pictures of the lumbar spine (the bones, disks, and other structures in the lower back).

Magnetic Resonance Imaging (MRI): Lumbar Spine (for ...

PURPOSE: To identify the magnetic resonance (MR) abnormalities of the lumbar spine that have a low prevalence in asymptomatic patients and thus determine the findings that are predictive of low back pain in symptomatic patients.

MR imaging of the lumbar spine: prevalence of ...

MRI stands for magnetic resonance imaging, and an MRI lumbar spine uses magnetic imaging technology to take detailed pictures of the inside of your body near the lumbar (lower) region of your spine. These images also capture the soft tissues, muscles, and organs in that part of your body.

On MR images, 97% of all levels of lumbar spondylolysis yielded one or more ancillary observations, including all 20 of the cases originally misdiagnosed. The combined use of ancillary observations and direct visualization of pars interarticularis defects makes MR imaging effective in revealing lumbar spondylolysis.

Magnetic resonance imaging of the lumbar spine in people without back pain. On MRI examination of the lumbar spine, many people without back pain have disk bulges or protrusions but not extrusions. Given the high prevalence of these findings and of back pain, the discovery by MRI of bulges or protrusions in people with low back pain may frequently be coincidental.

Magnetic resonance imaging of the lumbar spine in people ...

The correlated MR and CT and plain-film myelographic changes were divided into three anatomic groups: group 1 showed conglomerations of adherent roots residing centrally within the thecal sac, group 2 demonstrated roots adherent peripherally to the meninges giving rise to an "empty-sac" appearance, and group 3 demonstrated a soft-tissue mass replacing the subarachnoid space.

Magnetic resonance imaging of the lumbar spine with CT correlation The results of magnetic resonance (MR) imaging and computed tomography (CT) in 18 patients with known degenerative disk disease of the lumbar spine were compared. In 60 intervertebral disk levels studied, there were 17 disks with degeneration and disk bulge, and 15 herniated disks.

Magnetic resonance imaging of the lumbar spine with CT ...

The main features on MRI of the lumbar spine include features demonstrating underlying inflammation and its effects, such as bone marrow oedema, squaring of the vertebral bodies (Romanus lesions), syndesmophyte formation, ankylosis and erosions (Figure 5).

RACGP - Making sense of MRI of the lumbar spine

Two-thirds of degenerative diseases of the vertebral column involve the lumbar spine. Magnetic resonance imaging plays a pivotal role in diagnosis and treatment.

Depending on where you need magnetic resonance imaging, a small device called a coil may be placed around the body part being examined. The coil receives the magnetic resonance signal. Your technologist will monitor you from another room, but you can talk with him or her by microphone.
